

CMU SCS

Carnegie Mellon Univ. Dept. of Computer Science 15-415/615 - DB Applications

C. Faloutsos – A. Pavlo
Lecture#28: Modern Database Systems

CMU SCS

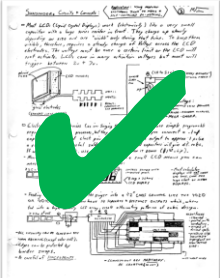

Administrivia – Final Exam

- **Who:** You
- **What:** R&G Chapters 15-22
- **When:** Tuesday May 6th 5:30pm- 8:30pm
- **Where:** WEH 7500
- **Why:** Databases will help your love life.

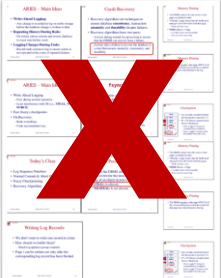

Faloutsos/Pavlo CMU SCS 15-415/615 2

CMU SCS

Administrivia – Final Exam

Handwritten Notes

Printed Notes

CMU SCS

Today's Class

- Distributed OLAP
- OldSQL vs. NoSQL vs. NewSQL
- How to scale a database system

Faloutsos/Pavlo CMU SCS 15-415/615 4

CMU SCS

OLTP vs. OLAP

- On-line Transaction Processing:
 - Short-lived txns.
 - Small footprint.
 - Repetitive operations.
- On-line Analytical Processing:
 - Long running queries.
 - Complex joins.
 - Exploratory queries.

Faloutsos/Pavlo CMU SCS 15-415/615 5

CMU SCS

Workload Characterization

Michael Stonebraker – "Ten Rules For Scalable Performance In Simple Operation Databases"
<http://www.cmu.edu/eng/engcourses/2011.6.10/6851>

CMU SCS

Relational Database Backlash

- New Internet start-ups hit the limits of single-node DBMSs.
- Early companies used custom middleware to shard databases across multiple DBMSs.
- Google was a pioneer in developing non-relational DBMS architectures.

Faloutsos/Pavlo CMU SCS 15-415/615 7

CMU SCS

MapReduce

- Simplified parallel computing paradigm for large-scale data analysis.
- Originally proposed by Google in 2004.
- Hadoop is the current leading open-source implementation.

Faloutsos/Pavlo CMU SCS 15-415/615 8

CMU SCS

MapReduce Example

Calculate total order amount per day after Jan 1st.

```

REDUCE(key, values) {
  sum = 0;
  while (values.hasNext()) {
    sum += values.next();
  }
  output(key, sum);
}

```

Faloutsos/Pavlo CMU SCS 15-415/615 9

CMU SCS

What MapReduce Does Right

- Since all intermediate results are written to HDFS, if one node crashes the entire query does not need to be restarted.
- Easy to load data and start running queries.
- Great for semi-structured data sets.

Faloutsos/Pavlo CMU SCS 15-415/615 10

CMU SCS

What MapReduce Did Wrong

- Have to parse/cast values every time:
 - Multi-attribute values handled by user code.
 - If data format changes, code must change.
- Expensive execution:
 - Have to send data to executors.
 - A simple join requires multiple MR jobs.

Faloutsos/Pavlo CMU SCS 15-415/615 11

CMU SCS

Join Example

- Find sourceIP that generated most adRevenue along with its average pageRank.

12

CMU SCS

Join Example – SQL

```

SELECT INTO Temp sourceIP,
                AVG(pageRank) AS avgPageRank,
                SUM(adRevenue) AS totalRevenue
FROM Rankings AS R, UserVisits AS UV
WHERE R.pageURL = UV.destURL
AND UV.visitDate BETWEEN "2000-01-15" AND "2000-01-22"
GROUP BY UV.sourceIP;

SELECT sourceIP, totalRevenue, avgPageRank
FROM Temp ORDER BY totalRevenue DESC LIMIT 1;
    
```

Faloutsos/Pavlo CMU SCS 15-415/615 13

CMU SCS

Join Example – MapReduce

Phase 1: Filter	Phase 2: Aggregation	Phase 3: Search
<p>Map: Emit all records for Rankings. Filter UserVisits data.</p> <p>Reduce: Compute cross product.</p>	<p>Map: Emit all tuples (i.e., passthrough)</p> <p>Reduce: Compute avg pageRank for each sourceIP.</p>	<p>Map: Emit all tuples (i.e., passthrough)</p> <p>Reduce: Scan entire input and emit the record with greatest adRevenue sum.</p>

Faloutsos/Pavlo CMU SCS 15-415/615 14

CMU SCS

Join Example – Results

- Find sourceIP that generated most adRevenue along with its average pageRank.

Nodes	Hadoop	Vertica	DBMS-X
25 nodes	~1250	32.0	29.2
50 nodes	~1250	35.4	29.4
100 nodes	~1150	55.0	31.9

Faloutsos/Pavlo CMU SCS 15-415/615 15

CMU SCS

Distributed Joins Are Hard

```
SELECT * FROM table1, table2
WHERE table1.val = table2.val
```

- Assume tables are horizontally partitioned:
 - Table1 Partition Key → table1.key
 - Table2 Partition Key → table2.key
- Q:** How to execute?
- Naïve solution is to send all partitions to a single node and compute join.

Faloutsos/Pavlo CMU SCS 15-415/615 16

CMU SCS

Semi-Joins

- First distribute the join attributes between nodes and then recreate the full tuples in the final output.
 - Send just enough data from each table to compute which rows to include in output.
- Lots of choices make this problem hard:
 - What to materialize?
 - Which table to send?

Faloutsos/Pavlo CMU SCS 15-415/615 17

CMU SCS

MapReduce in 2014

- SQL/Declarative Query Support
- Table Schemas
- Column-oriented storage.

Faloutsos/Pavlo CMU SCS 15-415/615 18

CMU SCS

Column Stores

- Store tables as sections of columns of data rather than as rows of data.

Faloutsos/Pavlo CMU SCS 15-415/615 19

CMU SCS

Column Stores

SELECT sex, AVG(GPA) FROM student GROUP BY sex

sid	name	login	age	gpa	sex
1001	Faloutsos	christos@cs	45	4.0	M
1002	Bieber	jbieber@cs	21	3.9	M
1003	Tupac	shakur@cs	26	3.5	M
1004	Ke\$ha	kesha@cs	22	4.0	F
1005	LadyGaGa	gaga@cs	24	3.5	F
1006	Obama	obama@cs	50	3.7	M

Row-oriented Storage

<name, login, age, gpa, sex>
 <name, login, age, gpa, sex>
 <name, login, age, gpa, sex>
 <sid, name, login, age, gpa, sex>
 <sid, name, login, age, gpa, sex>
 <sid, name, login, age, gpa, sex>
 <sid, name, login, age, gpa, sex>

Faloutsos/Pavlo CMU SCS 15-415/615 20

CMU SCS

Column Stores

SELECT sex, AVG(GPA) FROM student GROUP BY sex

sid	name	login	age	gpa	sex
1001	Faloutsos	christos@cs	45	4.0	M
1002	Bieber	jbieber@cs	21	3.9	M
1003	Tupac	shakur@cs	26	3.5	M
1004	Ke\$ha	kesha@cs	22	4.0	F
1005	LadyGaGa	gaga@cs	24	3.5	F
1006	Obama	obama@cs	50	3.7	M

Column-oriented Storage

sid name login age gpa sex

Faloutsos/Pavlo CMU SCS 15-415/615 21

CMU SCS

Column Stores

- Only scan the columns that a query needs.
- Allows for amazing compression ratios:
 - Values for the same query are usually similar.
- Main goal is delay materializing a record back to its row-oriented format for as long as possible inside of the DBMS.
- Inserts/Updates/Deletes are harder...

Faloutsos/Pavlo CMU SCS 15-415/615 22

CMU SCS

Column Store Systems

- Many column-store DBMSs
 - Examples: Vertica, Sybase IQ, MonetDB
- Hadoop storage library:
 - Example: Parquet, RCFile

Faloutsos/Pavlo CMU SCS 15-415/615 23

CMU SCS

NoSQL

- In addition to MapReduce, Google created a distributed DBMS called BigTable.
 - It used a GET/PUT API instead of SQL.
 - No support for txns.
- Newer systems have been created that follow BigTable’s anti-relational spirit.

Faloutsos/Pavlo CMU SCS 15-415/615 24

CMU SCS

NoSQL Systems

Key/Value	Column-Family	Documents
 redis  riak  FOUNDATIONDB  membase  amazon DynamoDB	 cassandra  APACHE HBASE  HYPERTABLE	 mongoDB  Couchbase  CouchDB  RethinkDB

Faloutsos/Pavlo CMU SCS 15-415/615 25

CMU SCS

NoSQL Drawbacks

- Developers write code to handle eventually consistent data, lack of transactions, and joins.
- Not all applications can give up strong transactional semantics.

Faloutsos/Pavlo CMU SCS 15-415/615 26

CMU SCS

NewSQL

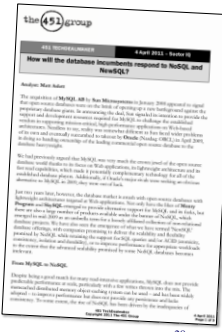

- Next generation of relational DBMSs that can scale like a NoSQL system but without giving up SQL or txns.

Faloutsos/Pavlo CMU SCS 15-415/615 27

CMU SCS

Aslett White Paper

[Systems that] deliver the scalability and flexibility promised by NoSQL while retaining the support for SQL queries and/or ACID, or to improve performance for appropriate workloads.

Matt Aslett - 451 Group (April 4th, 2011)
<https://www.451research.com/report-short?entityId=66963>

28

CMU SCS

Wikipedia Article

A class of modern relational database systems that provide the same scalable performance of NoSQL systems for OLTP workloads while still maintaining the ACID guarantees of a traditional database system.

Wikipedia (April 2014)
<http://en.wikipedia.org/wiki/NewSQL>

29

CMU SCS

NewSQL Systems

New Design	MySQL Engines	Middleware
		

Faloutsos/Pavlo CMU SCS 15-415/615 30

NewSQL Implementations

- Distributed Concurrency Control
- Main Memory Storage
- Hybrid Architectures
 - Support OLTP and OLAP in single DBMS.
- Query Code Compilation

Faloutsos/Pavlo CMU SCS 15-415/615 31
